

Percentage Charge by Volts

24 Volt Flooded Lead Acid (Wet Cell) Battery

Supplied by Barry Clark Marine

This graph shows approximate battery voltages representing percentage charge for a 24 volt flooded lead acid battery.

Batteries should not be discharged below half charge or 24.4 volts. Doing so will significantly reduce battery service life.

Discharged batteries should be returned to a fully charged state as soon as possible to maximise battery life.

Battery life is reduced by deep or prolonged discharge cycles.
